Representative x–y orbit geometry for nominal and 100 µm radial-out fields

First 100 RF periods from the identical clockwise launch · all plotted coordinates are integration samples

A Nominal h50 P4

B Δ = 100 µm h50 P4

● Rotating (solid) ▲ Standing (dashed)

Circle is the 8 mm aperture; the path window ends at 100 RF in both models and both geometries. Full radial records remain available in the CSV data.
