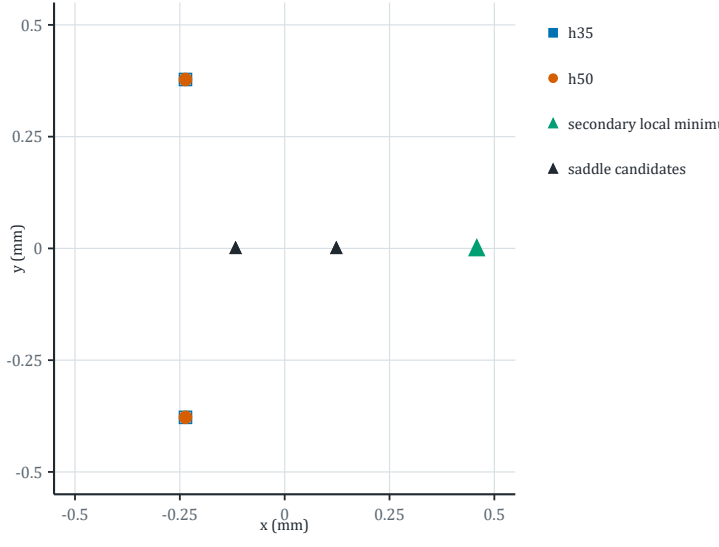
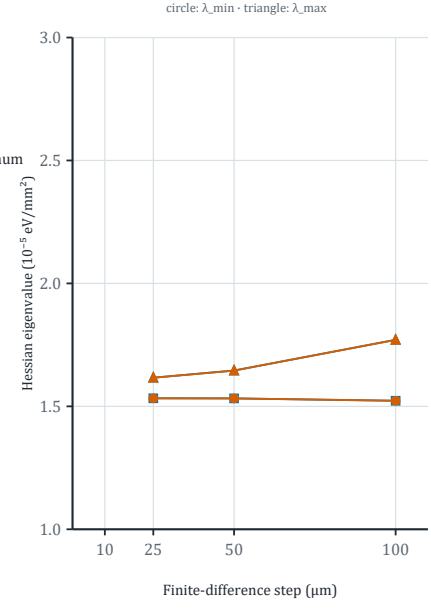
Stationary structure of the 10 μm radial-out effective potential

Existing full-domain P4 fields; located minima, finite-difference saddles and local curvature

A Located stationary points



B Local curvature versus spatial step



Global minima form a reflection-related pair; a second, higher local minimum lies near (0.458 mm, 0). Saddle markers have opposite-sign curvature eigenvalues.

Finite-element field gradients are elementwise; curvature is therefore reported as scale-dependent local finite differences.
