DC-bias differences relative to the unchanged zero-DC RF solution
Central proxy increment vs. bias
1e−5
Max proxy increment for r≤2 mm (fl)
Udc (V)
100 V
300 V
500 V
1000 V
0 V
Radial differential (Udc=0 is zero)
Proxy − ΨRF (fl)
Radius (mm)
Angular-anisotropy differentials vs. 0 V
Change at r≈2 mm (fl)
Angle (deg)
Static field magnitude (not RF pseudopotential)
Max static |EDC| in central grid (V/m)
